Business Domain

Our platform is based on the popular "20 Baht Shop" model, which is well-known for its fixed-price concept where all items sell for 20 THB. This concept is popular due to its affordability and accessibility within local communities. Traditionally, these shops operate as small physical stores, offering a wide range of affordable things, including household goods, stationery, kitchenware, toys, and daily necessities.

For that reason, we are transforming this concept into a digital store. The website is centralized, and scalable to maintain the unique fixed-price idea. It includes key functionalities such as product management, customer registration, and comprehensive order processing. The system provides various payment methods, and delivery. The administrators have full authority to manage the product stock , while customers can easily browse products, place orders, and complete payments online.

Wireframe

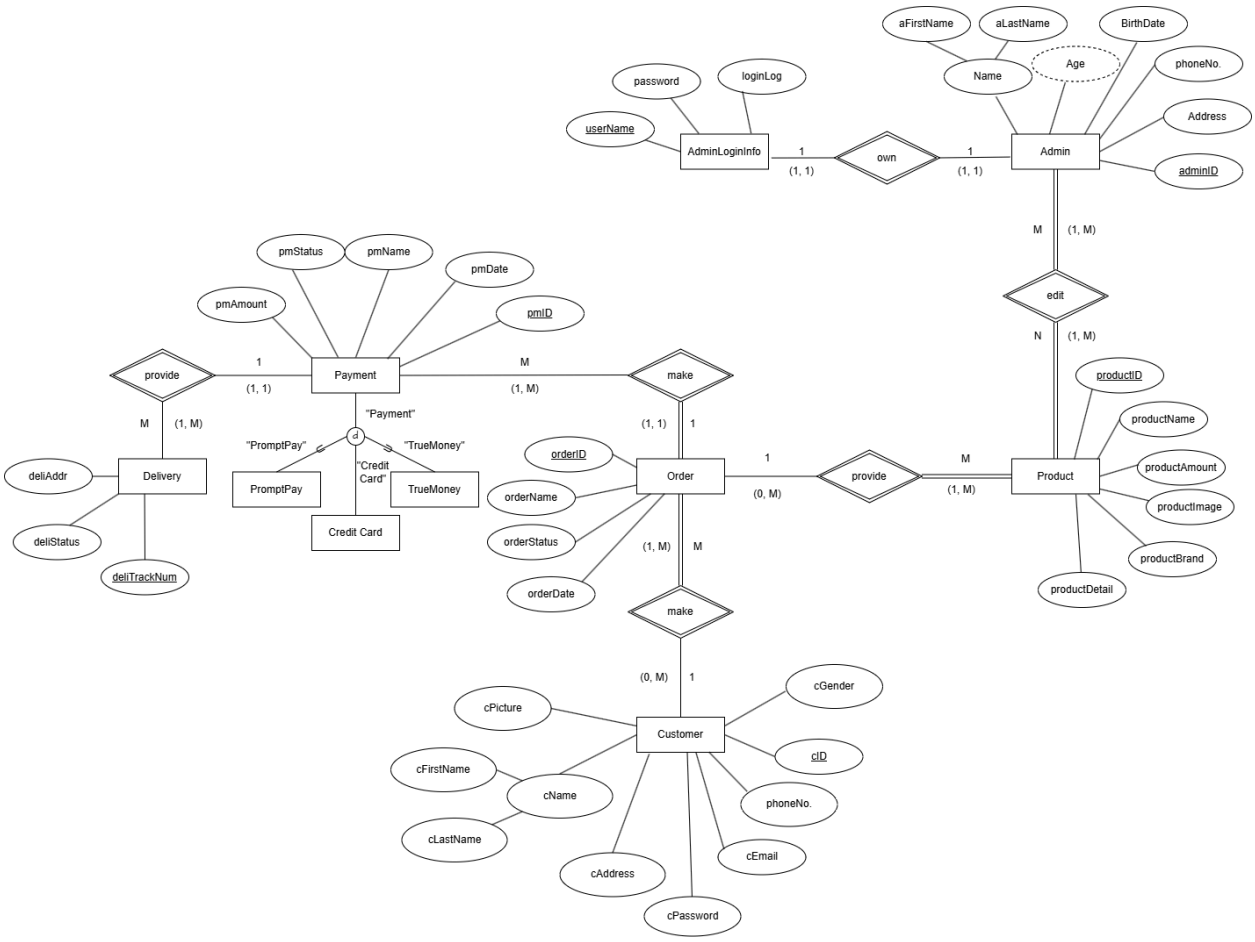

Figma Link: [ClickMe]

Firstly, the homepage is shown after you enter the website. However, the profile is not logged in yet, so the login/register button on the top right is provided. After clicking on that, you are brought to the login page. If you don't have an account, there is a register button that will take you to the register page. As the login process is done, the same homepage is shown, but the login/register button is now gone. On that page, there are navigation buttons and some recommended products that can bring you to the webpage. The webpage - shows interactive boxes of products. Whenever the product is clicked, the product information page is displayed.

In payment, users review items in the Store Cart, then proceed to billing and manage shipping details, and finally reach the transaction confirmation screen.

On the admin page, the admin requires an Admin Login to access the main dashboard for data overview, which then branches out to specific data modification interfaces.
